Notes and Potential Issues

The following notes and warnings highlight missing or conflicting information which caused the validator to perform some guesswork prior to

validation, or other things affecting the output below. If the guess or fallback is incorrect, it could make validation results entirely incoherent. It is

highly recommended to check these potential issues, and, if necessary, fix them and re-validate the document.

 Using experimental feature: HTML5 Conformance Checker.

The validator checked your document with an experimental feature: HTML5 Conformance Checker. This feature has been made available for

your convenience, but be aware that it may be unreliable, or not perfectly up to date with the latest development of some cutting-edge

technologies. If you find any issues with this feature, please report them. Thank you.

 No Character encoding declared at document level

No character encoding information was found within the document, either in an HTML meta element or an XML declaration. It is often

recommended to declare the character encoding in the document itself, especially if there is a chance that the document will be read from or

saved to disk, CD, etc.

See this tutorial on character encoding for techniques and explanations.

 Using Direct Input mode: UTF-8 character encoding assumed

Unlike the "by URI" and "by File Upload" modes, the "Direct Input" mode of the validator provides validated content in the form of characters

pasted or typed in the validator's form field. This will automatically make the data UTF-8, and therefore the validator does not need to

determine the character encoding of your document, and will ignore any charset information specified.

If you notice a discrepancy in detected character encoding between the "Direct Input" mode and other validator modes, this is likely to be the

reason. It is neither a bug in the validator, nor in your document.6/26/2014 [Invalid] Markup Validation of upload://Form Submission - W3C Markup Validator
